App Documentation for AI Assistant

Feature: Grid Builder

The **Grid Builder** is a powerful tool for creating fully customizable configuration interfaces based on the **Ag Grid** library. Users with access can design grids with various options including:

- Pagination
- Grouping
- Pivot tables
- Column options (full control over column settings such as sorting, filtering, visibility, width, etc.)

This tool allows building dynamic data grids tailored to specific application needs.

Feature: Permissions

To make a newly created interface visible in the app, users must follow these steps:

1. **Add the interface** in the **Interface List** menu found in the **Back Office** module.
2. **Create permissions** associated with the new interface/menu.
3. **Assign these permissions** to roles in the **Interface Role Permissions** section.

Once these steps are completed correctly, the new menu option will appear in the app's menu list for authorized users.

Feature: Bee Drive

Bee Drive is an extension module within the app designed for managing files related to financial balances. It organizes files based on:

- Accounting periods
- Modules
- Entities

How to Use Bee Drive:

1. Navigate to the **Bee Drive** module.
2. Access the drive interface if you are the **current Group.**
3. You can **upload files** related to balances, organized by period, module, and entity.
4. Bee Drive automatically **dispatches and moves files** to the correct storage locations according to their metadata.
5. It also **extracts data** from the uploaded files.
6. Extracted content is passed seamlessly into the system for further processing or reporting.

File Naming Rules

- For single company files: CompanyName_ReporingPeriod_DataModule exemple DEMO_RS2022_SOC.xlsx
- For multi-company files: $_ReporingPeriod_DataModule : $_RS2022_SOC1.xls

If the rules are not followed, when moving to the corresponding node, the missing attributes will be added automatically, and the file will be ready for import

App Modules

Monitoring Module

- Access the **Monitoring** module from the available list on the left sidebar.
- This module provides detailed logs and status information, including:
    - Process monitoring
    - Connection status
    - Controller access
    - Lock management
- Use this module to track and diagnose app activity and performance.

Consolidation Module

- Select the **Consolidation** module to view and manage data related to financial consolidation.

- It provides tools and information essential for consolidating data across entities or periods.

Module Rights

- This module manages **menu rights** and user permissions.
- It allows administrators to:
    - Define and assign rights related to menus.
    - Manage users, roles, and role permissions.
- Essential for controlling access and ensuring security within the app.

Structure and Perimeter Module

- Provides detailed information about the organizational structure and perimeter of entities within the current group.
- Includes:
    - Entity details
    - Reporting periods
    - Defined perimeters and scopes
- Help users understand the organizational context and boundaries for data and processes.
